

In the Claims:

1. (Currently Amended) A system for providing a roaming subscriber with access to services available in a first telephone network via a telephone connection, said subscriber roaming in a second telephone network, the system comprising:
a first service node for association with said first mobile telephone network,
a second service node for association with said second mobile telephone
network,

a packet-switch network for connecting said first ~~telephone network~~ service
node with said second ~~telephone network~~ service node,

B1 said first and said second service nodes being configured to establish said
telephone connection from said roaming mobile subscriber to a requested one of said
services in said first mobile telephone network and to exchange signals required for
said services between said first mobile network and said second telephone network
via said packet switch network thereby to support said substantially seamless access,
said signals comprising at least a subscriber identification signal to be transferred
from ~~wherein signals required for said services are transmitted between~~ said first
telephone network ~~and to~~ said second telephone network via said packet-switch
network with said telephone connection.

2. (Original) A system according to claim 1, wherein said first telephone network is one of a group including: a mobile telephone network, a fixed telephone network, a Global System for Mobile communications (GSM) network, a Time Divisions Multiple Access (TDMA) network, a Code Division Multiple Access (CDMA) network, an IS-41 network, and a private branch exchange (PBX).

3. (Original) A system according to claim 1, wherein said second telephone network is one of a group including: a mobile telephone network, a fixed telephone network, a Global System for Mobile communications (GSM) network, a Time Division Multiple Access (TDMA) network, a Code Division Multiple Access (CDMA) network, an IS-41 network, and a private branch exchange (PBX).

4. (Original) A system according to claim 1, further comprising a passive System Signaling Number 7 (SS7) monitor for monitoring SS7 signals and triggering the provision of access to at least one of said services when one of a group of predetermined SS7 signals has been detected.

5. (Original) A system according to claim 4, wherein said predetermined SS7 signals are Mobile Application Part (MAP) messages.

6. (Original) A system according to claim 5, wherein said messages are from a group including: short messages and location updates.

7. (Currently Amended) A system according to claim 1, ~~further comprising~~ wherein:

~~a-said~~ first service node is configured for transmitting said signals between said first telephone network and said packet-switch network; and

~~a-said~~ second service node is configured for transmitting said signals between said packet-switch network and said second telephone network.

8. (Previously Amended) A system according to claim 7, wherein said second service node transmits dial tone multi-frequency (DTMF) signals substantially concurrently with the creation of a voice path connecting said first telephone network with said second telephone network, and said first service node synchronizes said DTMF signals with said voice path.

9. (Original) A system according to claim 7, wherein said subscriber uses a short code dependent upon the location of said subscriber to access said second service node.

10. (Original) A system according to claim 7, wherein said first service node instructs said second service node via said packet-switch network to generate and send a short message.

11. (Original) A system according to claim 7, further comprising:
a user profile of said subscriber, said user profile comprising at least a subscriber calling line identification (CLI),

wherein said subscriber CLI is required for access to said services.

12. (Original) A system according to claim 11, wherein said second service node receives said subscriber CLI from DTMF signals sent by said subscriber.

13. (Original) A system according to claim 11, wherein said second service node receives a second CLI from said second telephone network and said second CLI is associated with said subscriber CLI.

14. (Original) A system according to claim 11, wherein said second service node creates a voice path connecting said second telephone network with said first telephone network using a second CLI of said second service node, and wherein said first service node replaces with second CLI with said subscriber CLI when accessing one of said services.

15. (Previously Amended) A system according to claim 1, wherein said services include voice message notification.

16. (Previously Amended) A system according to claim 1, wherein said services include voice message retrieval.

17. (Currently Amended) A method for providing a roaming subscriber at a remote telephone network with access to services available in a first telephone network, the method comprising the steps of:

connecting-attaching a first node to said first telephone network, wherein a second node is connected to said remote telephone network, and making a voice and signaling connection between said first and said second node to a second telephone network using a packet-switch network, thereby to support transfer of a subscriber identifying signal between said roaming subscriber and at least one of said services located at said first telephone network together with a voice connection to said services, thereby to render said at least one of said services available with voice operation to said roaming subscriber.~~roaming in said second telephone network; and~~

~~transmitting signals for said services over said packet-switch network.~~

18. (Original) A method according to claim 17, wherein said first telephone network is one of a group including: a mobile telephone network, a fixed telephone network, a Global System for Mobile communications (GSM) network, a Time Division Multiple Access (TDMA) network, a Code Division Multiple Access (CDMA) network, an IS-41 network, and a private branch exchange (PBX).

19. (Original) A method according to claim 17, wherein said second telephone network is one of a group including: a mobile telephone network, a fixed telephone network, a Global System for Mobile communications (GSM) network, a Time Division Multiple Access (TDMA) network, a Code Division Multiple Access (CDMA) network, an IS-41 network, and a private branch exchange (PBX).

20. (Original) A method according to claim 17, further comprising the steps of: monitoring SS7 signals; and

upon detection of one of a group of predetermined SS7 signals, triggering the provision of access to at least one of said services.

21. (Original) A method according to claim 20, wherein said predetermined SS7 signals are Mobile Application Part (MAP) messages.

22. (Original) A method according to claim 21, wherein said messages are from a group including: short messages and location updates.

B1 23. (Previously amended) A method according to claim 17, further comprising the steps of:

transferring dial tone multi-frequency (DTMF) signals over said packet-switch network;

substantially concurrently with said step of transferring, creating a voice path connecting said first telephone network with said second telephone network; and synchronizing said DTMF signals with said voice path.

24. (Original) A method according to claim 17, further comprising the step of: using a short code dependent upon the location of said subscriber to access one of said services.

25. (Original) A method according to claim 17, further comprising the step of: accessing said services using a subscriber calling line identification (CLI) stored in a user profile of said subscriber.

26. (Original) A method according to claim 25, further comprising the step of receiving said subscriber CLI from DTMF signals sent by said subscriber.

27. (Original) A method according to claim 25, further comprising the step of receiving a second CLI from said second telephone network, wherein said second CLI is associated with said subscriber CLI.

28. (Original) A method according to claim 25, further comprising the steps of:

creating a voice path connecting said second telephone network with said first telephone network using a second CLI; and

replacing said second CLI with said subscriber CLI when accessing one of said services.

29. (Previously Amended) A method according to claim 17, wherein said services include voice message notification.

BI 30. (Original) A method according to claim 17, wherein said services include voice message retrieval.

31. (New) A system according to claim 14, wherein said subscriber is enabled to use a short code dependent on the location of said subscriber to access said second service node. = 24

32. (New) A system according to claim 14, wherein said first service node is operable to instruct said second service node via said packet-switch network to generate and send a short message.

33. (New) The system of claim 1, wherein said first mobile telephone network comprises any one of a group comprising a global system for mobile communications (GSM) network, a time division multiple access (TDMA) network, a code division multiple access (CDMA) network, an IS-41 network and a private branch exchange (PBX), and said second mobile telephone network comprises any other of said group. ~ 2 # 3
3 5

34. (New) The system of claim 1, wherein:

said first mobile telephone network comprises any one of a group comprising a global system for mobile communications (GSM) network, a time division multiple access (TDMA) network, a code division multiple access (CDMA) network, an IS-41 network and a private branch exchange (PBX),

said second mobile telephone network comprises any one of said group, but either one of said first mobile telephone network and said second mobile telephone network is not a GSM network. *1 2*

81 35. (New) The method of claim 17, wherein said first mobile telephone network comprises any one of a group comprising a global system for mobile communications (GSM) network, a time division multiple access (TDMA) network, a code division multiple access (CDMA) network, an IS-41 network and a private branch exchange (PBX), and said second mobile telephone network comprises any other of said group.
